Question

What Type of Bonding?

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Covalent and ionic chlorides

Which of the following sets contain two covalent chlorides and two ionic chlorides?

1	$NaCl$	$BaCl_2$	CCl_4	ICl
2	$BeCl_2$	$SiCl_4$	$PbCl_4$	SCl_2
3	$CaCl_2$	$SiCl_4$	PCl_3	SCl_2

- **1, 2** and **3** are correct
- **1** and **2** only are correct
- **2** and **3** only are correct
- **1** only is correct
- **3** only is correct

Part B

Calcium chloride

Which of **ionic, metallic, purely covalent** or **polar covalent** best describes the type of bonding present in $CaCl_2$?

Part C

Phosphorus trichloride

Which of **ionic, metallic, purely covalent** or **polar covalent** best describes the type of bonding present in $\mathrm{PCl_3}$?

Part D

Chlorine

Which of **ionic, metallic, purely covalent** or **polar covalent** best describes the type of bonding present in $\mathrm{Cl_2}$?

Part E

Sodium

Which of **ionic, metallic, purely covalent** or **polar covalent** best describes the type of bonding present in Na?

Part F

Silicon dioxide

Which of **ionic, metallic, purely covalent** or **polar covalent** best describes the type of bonding present in $\mathrm{SiO_2}$?

Part A adapted with permission from UCLES, A-Level Chemistry, June 1991, Paper 1, Question 31;

Question

Lattice Enthalpy Definition

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Lattice enthalpy definition

Fill in the missing words:

Lattice enthalpy of formation $\Delta_{LE}H$ is the energy change when one [ ] of an ionic solid is formed from its [ ] [ ].

Lattice formation enthalpies are always [ ]. The magnitude of the lattice enthalpy is affected by both the ionic [ ] and the [ ] on the ions.

Items:

negative | ions | mole | gaseous | atoms | positive | charge | radii

Part B

Lattice energy

For which compound is the lattice energy likely to have the greatest numerical value (i.e. the greatest magnitude, disregarding the sign)?

- lithium fluoride
- lithium iodide
- rubidium chloride
- sodium chloride

Part A adapted with permission from OCSEB, A-Level Chemistry, June 1995, Special Paper, Question 4;
Part B adapted with permission from UCLES, A-Level Chemistry, November 1995, Paper 4, Question 7

STEM SMART Chemistry Week 6

Question

Lattice Enthalpy Estimation

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Within the ionic model, lattice enthalpies in $\mathrm{kJ\,mol^{-1}}$ may be estimated using the equation:

$$\Delta_{\mathrm{L}} H^{\ominus} = \frac{C \cdot z^{+} \cdot z^{-} \cdot \nu}{(r^{+} + r^{-})} - 2.5\nu$$

Where:

- C is a constant approximately equal to $105\,000$ units;
- z^{+} and z^{-} are the *signed* charges on the cation and anion respectively in units of e;
- ν is the number of ions in the formula (e.g. 3 for $\mathrm{MgI_2}$);
- r^{+} and r^{-} are the radii of the ions in pm;
- The -2.5ν term corrects for the difference between internal energy and enthalpy.

The table below shows the radii for certain ions.

Ion	$\mathrm{Li^+}$	$\mathrm{Na^+}$	$\mathrm{Ca^{2+}}$	$\mathrm{Cr^{3+}}$	$\mathrm{Hg^+}$	$\mathrm{O^{2-}}$	$\mathrm{F^-}$	$\mathrm{Cl^-}$	$\mathrm{Br^-}$
Radius / pm	74	102	100	62	158	140	133	180	195

Estimate the values of $\Delta_{\mathrm{L}} H^{\ominus}$ for the following compounds, using the equation given. Give your answers to 3 significant figures.

Part A

LiBr

$\Delta_{\mathrm{L}} H^{\ominus}$ for LiBr

Part B

Na_2O

$\Delta_L H^\circ$ for Na_2O

Part C

CaF_2

$\Delta_L H^\circ$ for CaF_2

Part D

Cr_2O_3

$\Delta_L H^\circ$ for Cr_2O_3

Part E

Hg_2Cl_2

$\Delta_L H^\circ$ for Hg_2Cl_2

Part F

Poor approximation

Experimentally found lattice enthalpies are:

Lattice	LiBr	$\mathrm{Na_2O}$	$\mathrm{CaF_2}$	$\mathrm{Cr_2O_3}$	$\mathrm{Hg_2Cl_2}$
$\Delta_{\mathrm{L}}H^{\ominus}$ / $\mathrm{kJ\,mol^{-1}}$	-800	-2530	-2635	-15115	-1950

For which compound is the ionic model a poor approximation?

Based on question F4.4 from the Physical Chemistry book

Question

Lattice Energy

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Lattice energy definition

Which equation defines the lattice energy of the ionic compound XY?

- $\mathrm{X(s) + Y(s) \longrightarrow XY(s)}$
- $\mathrm{X(g) + Y(g) \longrightarrow XY(s)}$
- $\mathrm{X^+(s) + Y^-(s) \longrightarrow XY(s)}$
- $\mathrm{X^+(g) + Y^-(g) \longrightarrow XY(s)}$

Part B

Lattice energies

The radius and charge of each of six ions are shown in the table.

ion	J^+	L^+	M^{2+}	X^-	Y^-	Z^{2-}
radius/nm	0.14	0.18	0.15	0.14	0.18	0.15

The ionic solids JX, LY and MZ are of the same lattice type.

What is the correct order of their lattice energies placing the one with the highest **magnitude** (most exothermic lattice formation enthalpy) first?

- $JX > LY > MZ$
- $JX > MZ > LY$
- $LY > MZ > JX$
- $MZ > JX > LY$
- $MZ > LY > JX$

Question

Covalent Bonding

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Number of bonding electrons

Which of the following molecules contains six bonding electrons?

- C_2H_4
- CO_2
- H_2S
- NCl_3
- $SiCl_4$

Part B

$\mathrm{P-H}$ and $\mathrm{Cl-H}$ bonds

The $\mathrm{P-H}$ bond energy is well approximated by the mean (arithmetic average) of the $\mathrm{H-H}$ and $\mathrm{P-P}$ values. Which of the statements are relevant to explaining why the $\mathrm{H-Cl}$ bond energy is **not** well approximated by the mean of the $\mathrm{H-H}$ and $\mathrm{Cl-Cl}$ values?

Some bond energy values are given in the table below:

bond	bond energy/$\mathrm{kJ\,mol^{-1}}$	bond	bond energy/$\mathrm{kJ\,mol^{-1}}$
$\mathrm{H-H}$	436	$\mathrm{H-H}$	436
$\mathrm{P-P}$	208	$\mathrm{Cl-Cl}$	244
$\mathrm{P-H}$	322	$\mathrm{H-Cl}$	431

1 The $\mathrm{Cl-H}$ bond is more polar than the $\mathrm{P-H}$ bond.
2 Cl has a smaller covalent radius than P.
3 P has five valence electrons whereas Cl has seven.

- **1, 2** and **3** are relevant
- **1** and **2** only are relevant
- **2** and **3** only are relevant
- **1** only is relevant
- **3** only is relevant

Question

Dipoles

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Dipoles 1

Which of the following molecules has **no** permanent dipole?

- CCl_2F_2
- C_2Cl_4
- $CHCl_3$
- C_2H_5Cl

Part B

Dipoles 2

In which pair of molecules is the permanent dipole in molecule **I** greater than that in molecule **II**?

	I	II
A		B	CH_3CH_2Cl	CH_3CHCl_2
C		D		
Figure 1: Dipoles.

The hexagonal structures are *benzene rings*. Benzene has formula C_6H_6 and can be viewed as having alternating single and double bonds, although in actual fact all $C-C$ bonds are the same length and are somewhere between single and double bonds, hence is a circle is drawn to represent this.

The hydrogen atoms are not usually drawn on. Substituted benzenes have different groups attached in place of hydrogen which are indicated.

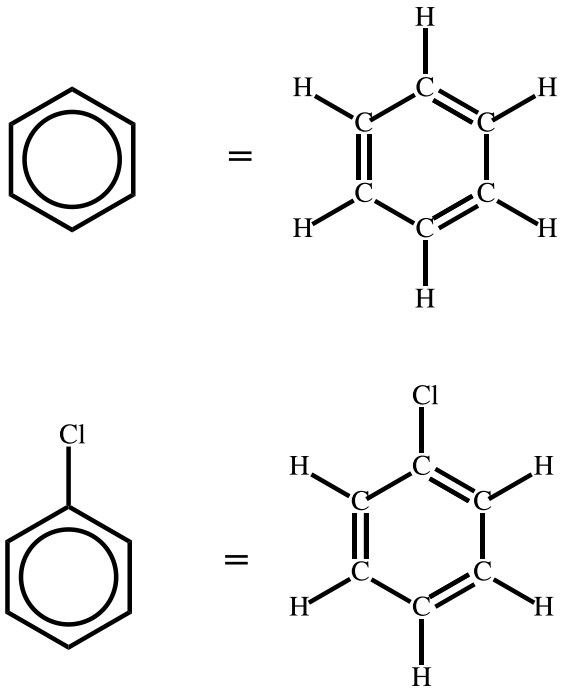

Figure 2: Representations of **benzene**, C_6H_6 and **chlorobenzene**, C_6H_5Cl.

- A
- B
- C
- D

Question

Van der Waals and Paraffin wax

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Van der Waals forces

Which of the following compounds in their solid states consist of atoms or molecules held together only by van der Waals forces (due to some form of dipole-dipole interaction)?

- H_2O
- MgO
- Cu
- SiO_2
- CO_2

Part B

Melting point of paraffin wax

The melting point of paraffin wax (a mixture of saturated hydrocarbons which have high relative molar mass) is determined by

- covalent bonds within hydrocarbon molecules
- covalent bonds between hydrogen carbon molecules
- ionic bonds between molecules
- hydrogen bonds between molecules
- van der Waals (London dispersion) forces between the molecules

Part A adapted with permission from UCLES, A-Level Chemistry, November 1990, Paper 1, Question 1;
Part B adapted with permission from OCSEB, A-Level Chemistry, June 1994, Paper 1, Question 3

Question

Hydrogen Bonding and Methane

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Part A

Effects of intermolecular hydrogen bonding

Which of the following statements describes a phenomenon which can be explained by intermolecular hydrogen-bonding?

- The melting points of the Group 1 hydroxides decrease with increasing relative formula mass (M_r)
- The boiling points of the alkanes increase with increasing relative molecular mass.
- $\mathrm{CH_3OCH_3}$ ($M_\mathrm{r} = 46$) has a higher boiling point than $\mathrm{CH_3CH_2CH_3}$ ($M_\mathrm{r} = 44$).
- Hydrogen chloride forms an acidic solution when dissolved in water.
- Ice has a lower density than water at $0\,^\circ\mathrm{C}$.

Part B

Condensed methane

The Voyager 2 probe has shown that the surface of Triton, a moon of the planet Neptune, contains condensed methane which flows rapidly.

Which statement explains the flow within the condensed methane?

- Condensed methane has a metallic structure.
- Methane molecules contain strong $\mathrm{C-H}$ bonds.
- Methane molecules have a tetrahedral structure.
- The intermolecular forces between methane molecules are weak.

Question

Diamond and Graphite

Subject & topics: Chemistry | Inorganic | Bonding & IMFs **Stage & difficulty:** A Level P1

Which structural feature is common to both diamond and graphite?

- a carbon-carbon bond length equal to that in ethane
- covalent bonds between carbon atoms
- delocalised electrons
- each carbon atom is bonded to four others
- weak forces between layers

Adapted with permission from UCLES, A-Level Chemistry, November 1993, Paper 4, Question 17
