

Oxidation Yield

A Level

Oxidation of phenylethene (12.0 g, C_8H_8) gave benzoic acid ($\text{C}_7\text{H}_6\text{O}_2$), which needed 100 cm^3 of 1.00 mol dm^{-3} aqueous NaOH for neutralisation. The benzoic acid only has one acidic group and so reacts with the hydroxide in a 1 : 1 molar ratio.

Calculate the percentage yield of benzoic acid from phenylethene in this reaction rounding to the nearest integer.

Yield vs Atom Economy

Identify the correct statements about percentage yield and atom economy.

1. Both percentage yield and atom economy can theoretically range from 0 % to 100 %.
2. The percentage yield of a reaction is always less than or equal to its atom economy.
3. The atom economy of a reaction will always be increased by adding a catalyst.

- ☐ 1 only
- ☐ 2 only
- ☐ 3 only
- ☐ 1 and 2
- ☐ 1 and 3
- ☐ 2 and 3
- ☐ None of the above
- ☐ All of the above

Smelting

A Level

Smelting of metal ores is often carried out with carbon monoxide. The metal ore is reduced by the carbon monoxide gas, which is itself oxidised to carbon dioxide (a waste product) in the process.

Consider the above occurring for the reduction of CuO and Fe_2O_3 to the respective metals: copper and iron. Calculate the atom economy for each of these two reactions, giving your answer as a percentage rounded to the nearest integer.

Part A CuO

Calculate the atom economy for the reduction of CuO .

Part B Fe_2O_3

Calculate the atom economy for the reduction of Fe_2O_3 .

Step and Overall Yield

A synthesis from phenol ($\text{C}_6\text{H}_6\text{O}$) to give **G** ($\text{C}_8\text{H}_8\text{O}_2$) was carried out as shown below.

Figure 1: Three-step synthesis starting from phenol.

Part A Overall yield

47.0 g of phenol ($\text{C}_6\text{H}_6\text{O}$) gave 44.5 g of the final product **G** ($\text{C}_8\text{H}_8\text{O}_2$). What is the overall percentage yield of **G** from phenol? Give your answer to the nearest integer.

Part B Step II yield

The yield for step I, for the conversion of phenol to **E** ($\text{C}_8\text{H}_8\text{O}_2$), was 75 %, and the yield for the hydrolysis of **F** ($\text{C}_{10}\text{H}_{10}\text{O}_3$) to **G** ($\text{C}_8\text{H}_8\text{O}_2$) in step III was 100 %. What is the percentage yield for step II? Give your answer to the nearest integer.

Alcohol Oxidation Efficiency

A Level

A student was given the following instructions for the preparation and identification of a carbonyl compound:

To 100 cm³ of water in a flask, carefully add 30 cm³ of concentrated sulfuric acid and set up the apparatus for distillation.

Make up a solution containing 28.0 g of sodium dichromate(VI), Na₂Cr₂O₇ in 15.0 cm³ of water; add 18.0 g of the alcohol, C₃H₈O, and pour the solution into a dropping funnel connected to the flask.

Boil the acid in the flask. Add the mixture containing the alcohol at such a rate that the product is collected slowly.

Re-distil the crude product and collect the fraction that boils between 48 °C and 50 °C.

The balanced equation for the process taking place is shown below:

The student obtained 7.20 g of the carbonyl compound, C₃H₆O.

Part A Atom economy

Calculate the atom economy for this process, treating only the carbonyl compound as a useful product. Give your answer expressed as a percentage and rounded to the nearest integer.

Part B Moles of dichromate

Calculate how many moles of $\text{Na}_2\text{Cr}_2\text{O}_7$ were used.

Part C Limiting reagent

Identify which reagent was limiting and fill in its molecular formula. Assume that concentrated sulfuric acid has a concentration of 18.4 mol dm^{-3} .

Part D Percentage yield

Calculate the percentage yield obtained by the student. Give your answer rounded to the nearest integer.

Reactions 4

Essential Pre-Uni Chemistry B6.4

Calculate the volume of $0.50 \text{ mol dm}^{-3} \text{ H}_2\text{SO}_4$ required to neutralize each of the following. Give your answer in cm^3 unless otherwise specified.

Part A (a)

25.0 cm^3 of $1.0 \text{ mol dm}^{-3} \text{ NaOH}$

Part B (b)

3.0 g CaCO_3

Part C (c)

1.25 g ZnCO_3

Part D (d)

4.03 kg MgO . Give your answer in dm^3 .

Part E (e)

100 cm³ of 0.2 mol dm⁻³ NH₃ (aq)

Titration 2

Essential Pre-Uni Chemistry B7.2

2.50 g of an unknown carbonate were dissolved in 100 cm³ of 1.00 mol dm⁻³ hydrochloric acid (an excess). The resulting solution was made up to 250 cm³ in a volumetric flask. 25.00 cm³ aliquots of this solution were titrated against 0.250 mol dm⁻³ sodium hydroxide. Some of the results are shown below. Fill in the gaps in the table (Parts A-D), and then calculate the quantities in Parts E-L to identify the cation (Part M).

Titration	Initial burette reading / cm ³	Final burette reading / cm ³	Titre / cm ³
Rough	0.60	25.10	Part A
1	0.15	Part B	24.10
2	Part C	25.25	24.45
3	1.35	25.45	Part D

Part A Rough, Titre/cm³

Give your answer to 4 significant figures.

Part B 1, Final burette reading/cm³

Give your answer to 4 significant figures.

Part C 2, Initial burette reading/cm³

Give your answer to 2 significant figures.

Part D 3, Titre/cm³

Give your answer to 4 significant figures.

Part E Average concordant titre

Calculate the average concordant titre. Give your answer to 4 significant figures.

Part F Amount of sodium hydroxide

Calculate the amount of sodium hydroxide in that volume. Give your answer to 3 significant figures.

Part G Amount of hydrochloric acid

The amount of hydrochloric acid in each aliquot. Give your answer to 3 significant figures.

Part H **Initial amount of HCl**

Calculate the initial amount of hydrochloric acid added to the carbonate. Give your answer to 3 significant figures.

Part I **Final amount of HCl**

Calculate the amount of hydrochloric acid remaining after reaction. Give your answer to 3 significant figures.

Part J **Amount of HCl used**

Calculate the amount of hydrochloric acid used in reaction with the carbonate. Give your answer to 3 significant figures.

Part K **Amount of carbonate**

Calculate the amount of carbonate in 2.50 g. Give your answer to 3 significant figures.

Part L **Molar mass of carbonate**

Calculate the molar mass of the carbonate. Give your answer to 3 significant figures.

Part M Identity of cation

Identify the cation in the carbonate.

Titrating Calcium Ions

A Level

The concentration of calcium ions in hard water can be determined by titration with a reagent X which forms a complex with $\text{Ca}^{2+}(\text{aq})$, giving a change of colour. Three moles of X combine with one mole of $\text{Ca}^{2+}(\text{aq})$.

A 25.0 cm^3 sample of hard water reacted with 24.0 cm^3 of $1.00 \times 10^{-4}\text{ mol dm}^{-3}$ X(aq).

Determine the concentration, in mol dm^{-3} , of calcium ions in the hard water.

Titrating Sulfur Dioxide

A Level

Sulfur dioxide is a by-product of the combustion of coal in power stations. It can react with oxygen and water vapour in the air to form sulfuric acid, H_2SO_4 . This is one of the causes of acid rain.

The amount of sulfur dioxide in the air may be determined by bubbling a sample of the air through sodium hydroxide solution, where it reacts according to the equation below:

The concentration of the unreacted sodium hydroxide can be determined by titration against a standard solution of hydrochloric acid.

1000 dm^3 of air were bubbled through 200 cm^3 of a 1.00 mol dm^{-3} solution of sodium hydroxide. The remaining solution was diluted to 1000 cm^3 with water, and 25.0 cm^3 of this solution was neutralised by 20.4 cm^3 of a 0.100 mol dm^{-3} solution of hydrochloric acid.

Part A H_2SO_4 formation

Construct an overall equation for the formation of sulfuric acid from sulfur dioxide (do not include state symbols). Balance it so as to use the smallest possible integer coefficients.

Part B Neutralisation reaction

Give the (net) ionic equation for the reaction of sodium hydroxide with hydrochloric acid.

Part C Unreacted moles

Find the amount, in moles, of unreacted sodium hydroxide.

Part D Sulfur dioxide moles

Find the amount, in moles, of sulfur dioxide in 1000 dm^3 of air.

Part E Percentage by volume

Hence calculate the percentage by volume of sulfur dioxide in air. (You may assume 1 mol of any gas occupies 24 dm^3 at this temperature and pressure.)

Titration 4

A Level

Essential Pre-Uni Chemistry B7.4

Three students each prepare a standard solution by dissolving 10.6 g of solid from different bottles labelled 'sodium carbonate' in exactly 1 dm^3 of water. They use this standard solution in a titration to determine the exact concentration of a solution of sulfuric acid at approximately 0.1 mol dm^{-3} . They each use a pipette to measure out exactly 25.00 cm^3 of the standard solution into a conical flask, they each use the same indicator and they each carry out their titrations with great care and accuracy.

The volumes of sulfuric acid solution that they each use are listed below. Only student A finds the correct concentration of the sulfuric acid. Student B is within 20 % but student C is so far out that they know something is wrong. Student C asks for help and is reminded that some solids can contain water of crystallisation. Student A uses anhydrous sodium carbonate, but what is x in the formula $\text{Na}_2\text{CO}_3 \cdot x\text{H}_2\text{O} (\text{s})$ for students B and C?

Student A: 23.75 cm^3

Student B: 20.20 cm^3

Student C: 8.80 cm^3

Part A Acid concentration

Calculate the exact concentration of the sulfuric acid. Give your answer to 3 significant figures.

Part B $\text{Na}_2\text{CO}_3 \cdot x\text{H}_2\text{O}(\text{s})$

Find x in $\text{Na}_2\text{CO}_3 \cdot x\text{H}_2\text{O}(\text{s})$ for student B.

Find x in $\text{Na}_2\text{CO}_3 \cdot x\text{H}_2\text{O}(\text{s})$ for student C.
