

Complex Numbers: Polar Form 3ii

Further A

Part A Expression for $z_1 z_2$

Given that $z_1 = 2e^{\frac{1}{6}\pi i}$ and $z_2 = 3e^{\frac{1}{4}\pi i}$, express $z_1 z_2$ in the form $re^{i\theta}$.

$r > 0$ and $0 \leq \theta < 2\pi$.

The following symbols may be useful: e, i, pi

Part B Expression for $\frac{z_1}{z_2}$

Express $\frac{z_1}{z_2}$ in the form $re^{i\theta}$, where $r > 0$ and $0 \leq \theta < 2\pi$.

The following symbols may be useful: e, i, pi

Part C Expression for w^{-5}

Given that $w = 2\left(\cos \frac{1}{8}\pi + i \sin \frac{1}{8}\pi\right)$, express w^{-5} in the form $r(\cos \theta + i \sin \theta)$, where $r > 0$ and $0 \leq \theta < 2\pi$.

The following symbols may be useful: cos(), i, pi, sin()

Complex Numbers: Polar Form 1i

Further A

Part A $z^6 = 1$

Solve the equation $z^6 = 1$, giving your answers in the form $re^{i\theta}$ where $0 \leq \theta < 2\pi$ and $0 < r$.

Write your answer in terms of k where $k = 0, 1, 2, 3, 4, 5$.

The following symbols may be useful: e, i, k, pi

Part B Argand diagram

Sketch an Argand diagram showing the solutions to $z^6 = 1$.

When you have made your sketch, answer this question to see an example sketch: Which of the four sketches in **Figure 1** is most accurate?

Figure 1: Four Argand diagram sketches.

- ☐ Sketch A
- ☐ Sketch B
- ☐ Sketch C
- ☐ Sketch D

Part C $(1 + i)^6$

Evaluate $(1 + i)^6$.

Give your answer in the form $x + iy$.

The following symbols may be useful: i

Part D $z^6 + 8i = 0$

Hence, or otherwise, solve the equation $z^6 + 8i = 0$, giving your answers in the form $re^{\pi i(a+bk)}$ where $k = 0, 1, 2, 3, 4, 5$.

$r > 0$ and $0 \leq \arg z < 2\pi$.

Find r .

Find a .

Find b .

Complex Numbers: De Moivre 3ii

Further A

Part A $\cos 5\theta$

Use de Moivre's theorem to show that $\cos 5\theta \equiv f(\cos \theta)$.

What is $f(\cos \theta)$?

The following symbols may be useful: $\cos()$, θ

Part B **Quartic roots**

Hence find the roots of $16x^4 - 20x^2 + 5 = 0$ in the form $\cos \alpha$ where $0 \leq \alpha \leq \pi$.

Give the solutions x_i in order of increasing value of α .

State x_1 .

The following symbols may be useful: $\cos()$, π

State x_2 .

The following symbols may be useful: $\cos()$, π

State x_3 .

The following symbols may be useful: $\cos()$, π

State x_4 .

The following symbols may be useful: $\cos()$, π

Part C $\cos \frac{1}{10} \pi$

Hence find the exact value of $\cos \frac{1}{10} \pi$.

Gameboard:

STEM SMART Double Maths 32 - Complex Exponentials & Hyperbolic Functions

Complex Numbers: De Moivre 1i

Further A

The series C and S are defined for $0 < \theta < \pi$ by

$$C = 1 + \cos \theta + \cos 2\theta + \cos 3\theta + \cos 4\theta + \cos 5\theta,$$
$$S = \sin \theta + \sin 2\theta + \sin 3\theta + \sin 4\theta + \sin 5\theta.$$

Part A $C + iS$

Write $C + iS$ in terms of exponentials.

The following symbols may be useful: e, i, theta

Part B Expression for C

Deduce that C can be written as a product of trigonometric functions of the form $\sin a\theta \cos b\theta \operatorname{cosec} c\theta$ where a , b and c are rational numbers. Write down that expression for C .

The following symbols may be useful: cos(), cosec(), sin(), theta

Part C Expression for S

Write down a corresponding expression for S as a product of trigonometric functions.

The following symbols may be useful: cosec(), sin(), theta

Part D Solving $C = S$

Hence find the values of θ , in the range $0 < \theta < \pi$, for which $C = S$.

Write your answers, θ_i , in increasing order.

What is θ_1 ?

The following symbols may be useful: π

What is θ_2 ?

The following symbols may be useful: π

What is θ_3 ?

The following symbols may be useful: π

What is θ_4 ?

Complex Numbers: De Moivre 5i

Further A

Part A $\sin^6 \theta$

By expressing $\sin \theta$ in terms of $e^{i\theta}$ and $e^{-i\theta}$, show that

$$\sin^6 \theta \equiv f(\cos 6\theta, \cos 4\theta, \cos 2\theta).$$

What is $f(\cos 6\theta, \cos 4\theta, \cos 2\theta)$?

The following symbols may be useful: $\cos()$, θ

Part B $\cos^6 \theta$

Replace θ by $(\frac{1}{2}\pi - \theta)$ in the identity in part A to obtain a similar identity for $\cos^6 \theta$ of the form

$$\cos^6 \theta = g(\cos 6\theta, \cos 4\theta, \cos 2\theta).$$

What is $g(\cos 6\theta, \cos 4\theta, \cos 2\theta)$?

The following symbols may be useful: $\cos()$, θ

Part C Value of an integral

Hence find the exact value of

$$\int_0^{\frac{1}{4}\pi} (\sin^6 \theta - \cos^6 \theta) \, d\theta.$$

Hyperbolic Functions: Manipulations 1ii

Further A

Part A $\cosh x \cosh y - \sinh x \sinh y$

Using the definitions of hyperbolic functions in terms of exponentials, prove that

$$\cosh x \cosh y - \sinh x \sinh y = \cosh(f(x, y)).$$

What is $f(x, y)$?

The following symbols may be useful: x , y

Part B Solving for y

Given that $\cosh x \cosh y = 9$ and $\sinh x \sinh y = 8$, write an expression for y in terms of x .

The following symbols may be useful: x , y

Part C Possible values of x and y

Hence find the values of x and y which satisfy the equations given in part B, giving the answers in logarithmic form.

What are the values of x ? Write your answer using the \pm symbol.

The following symbols may be useful: $\ln()$, $\log()$

What are the values of y ? Write your answer using the \pm symbol.

The following symbols may be useful: $\ln()$, $\log()$

Hyperbolic Functions: Manipulations 3i

Further A

Part A Defining $\tanh y$

Write an expression for $\tanh y$ in terms of e^y and e^{-y} .

The following symbols may be useful: e , y

Part B Log form of $\operatorname{artanh} x$

Given that $y = \operatorname{artanh} x$, where $-1 < x < 1$, write an expression for y as a logarithm in terms of x .

The following symbols may be useful: $\ln()$, $\log()$, x

Part C Solve $3 \cosh x = 4 \sinh x$

Find the exact solution of the equation $3 \cosh x = 4 \sinh x$, giving the answer in terms of a logarithm.

The following symbols may be useful: $\ln()$, $\log()$

Part D **Solve** $\operatorname{artanh} x + \ln(1 - x) = \ln\left(\frac{4}{5}\right)$

Solve the equation

$$\operatorname{artanh} x + \ln(1 - x) = \ln\left(\frac{4}{5}\right).$$

You may wish to use the \pm symbol.

Hyperbolic Functions: Differentiation 2ii

Further A

The equation of a curve is $y = \cosh x - 2 \sinh 2x$.

Part A $\frac{dy}{dx}$

Find an expression for $\frac{dy}{dx}$ in terms of hyperbolic functions.

The following symbols may be useful: $\operatorname{cosech}()$, $\cosh()$, $\coth()$, $\operatorname{sech}()$, $\sinh()$, $\tanh()$

Part B Turning points

Hence, explain why the curve has no turning points.

Drag six of the items to the right-hand column, and order them correctly to make an example proof.

Available items

For the function in this question, the equation for the x coordinate of a turning point is: $\sinh x - 4 \cosh 2x = 0$.

This is a quadratic equation in $\cosh x$.

$\frac{dy}{dx} = 0$ for all x , so we have no turning points. QED

We begin by stating that at a turning point, $\frac{dy}{dx} > 0$.

The discriminant is > 0 , therefore the equation has no real roots.

We begin by stating that at a turning point, $\frac{dy}{dx} = 0$.

For the function in this question, the equation for the x coordinate of a turning point is: $\sinh x + 4 \cosh 2x = 0$

This equation rearranges to $8 \sinh^2 x - \sinh x - 4 = 0$.

This is a quadratic equation in $\sinh x$.

The discriminant is < 0 , therefore the equation has no real roots.

$\frac{dy}{dx} \neq 0$ for all x , so we have no turning points. QED

This equation rearranges to $8 \sinh^2 x - \sinh x + 4 = 0$.

Hyperbolic Functions: Integration 1ii

Further A

Part A Definition of $\cosh x$

Using the definition of $\cosh x$ in terms of e^x and e^{-x} , write $\cosh 2x$ in terms of $\cosh^2 x$.

Give your answer in the form $\cosh 2x = f(\cosh^2 x)$

The following symbols may be useful: $\operatorname{cosech}()$, $\cosh()$, $\coth()$, $\operatorname{sech}()$, $\sinh()$, $\tanh()$, x

Part B $\int_0^1 \cosh^2 3x \, dx$

Find

$$\int_0^1 \cosh^2 3x \, dx,$$

giving your answer in the form $A + B \sinh C$, where A , B and C are constants to be found.

The following symbols may be useful: $\operatorname{cosech}()$, $\cosh()$, $\coth()$, $\operatorname{sech}()$, $\sinh()$, $\tanh()$
