Sense & Movement Nervous System Organisation

# **Nervous System Organisation**

The vertebrate nervous system can be categorised into different subsystems, based on structure and/or function.

Part A Levels of	organisation		
Complete the table be	elow to show the organisation	of the vertebrate nervous sys	stem.
	central nervous system		
nervous system		nervous system	
	nervous system	nervous system	sympathetic nervous system
		nervous system	nervous system
Items:    peripheral parasym	npathetic autonomic somatic		

#### Part B Nervous subsystem descriptions

Match the nervous subsystem to the description in the table below.

Description	Nervous subsystem
the brain and spinal cord	
all of the neurones that connect the central nervous system to other organs/tissues	
the parts of the nervous system that are under <b>subconscious</b> control	
the parts of the nervous system that are under conscious control	
the parts of the autonomic nervous system that are involved in triggering a "fight-or-flight" response	
the parts of the autonomic nervous system that are involved in "rest & digest" functions	

#### Items:

 sympathetic nervous system
 somatic nervous system
 parasympathetic nervous system

 peripheral nervous system (PNS)
 central nervous system (CNS)
 autonomic nervous system

#### Part C Somatic nervous system

Which of the following actions/behaviours are mainly controlled by the <b>somatic</b> nervous system? Select all that apply.
typing on a keyboard
stomach peristalsis
pupil dilation
blinking
dancing
producing saliva
Part D Autonomic nervous system
Part D Autonomic nervous system  Which of the following actions/behaviours are mainly controlled by the autonomic nervous system? Select all that apply.
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator  breathing
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator  breathing  sweating
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator  breathing  sweating  decreasing heart rate
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator  breathing  sweating  decreasing heart rate  chewing food
Which of the following actions/behaviours are mainly controlled by the <b>autonomic</b> nervous system? Select all that apply.  running away from a predator  breathing  sweating  decreasing heart rate  chewing food

Home Gameboard Biology Physiology Sense & Movement Neurone Structure

## **Neurone Structure**

Neurones are highly specialised cells with a unique structure. The various parts of a neurone carry out different roles in the overall function of the neurone.

**Figure 1:** Part of a motor neurone.

### Part A Label the neurone

Match the letter in **Figure 1** to the region/structure in the table below.

Letter	Region/structure
А	
В	
С	
D	
E	
F	
myelin sheath dendron	node of Ranvier dendrites axon cell body (soma)
Part B Myelin Which of the following state	ments about myelin are correct? Select all that apply.
	eed of an impulse along a neurone by being a strong conductor of electricity
myelin increases the spe	eed of an impulse along a neurone by preventing ion movement across the neurone membrane at that
a myelin sheath is compaxon/dendron	osed of extra layers of the neurone's own membrane that are deposited at a specific point along the
a myelin sheath is compaxon/dendron of a neuro	osed of layers of another cell's membrane that are wrapped around a specific point of the one
myelin in the peripheral	nervous system (PNS) is formed by Schwann cells
all neurones are myelina	ated

#### Part C Synapse at E

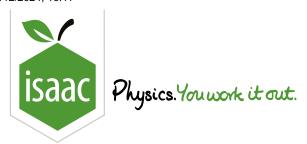

Which that a	n of the following cell types could form a synapse with the neurone at region <b>E</b> in <b>Figure 1</b> ? Select all pply.
	muscle cell
	gland cell
	sensory neurone
	motor neurone
	relay neurone

Home Gameboard Biology Physiology Sense & Movement Neurone Types

# **Neurone Types**

There are many different types of neurones, but most can be grouped into one of three main categories: motor neurones, sensory neurones, and relay neurones (interneurons).

#### Part A Types & functions

Match the type of neurone to the function in the table below.

Neurone type	Function
	(also called afferent neurones) receive impulses from a sense organ (e.g. skin, eyes, etc.) and transmit them to one or more neurones
	(also called efferent neurones) receive impulses from one or more neurones and transmit them to a muscle or gland
	(also called interneurons) transmit impulses from one neurone to another

Items:

sensory neurones motor neurones relay neurons

### Part B Characteristics

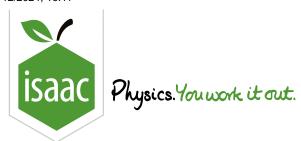

Match the neurone type(s) to the characteristic in the table below.

Characteristic	Neurone type(s)
is myelinated	
may form a synapse with a relay neurone	
cell body lies within the CNS	
dendron is usually longer than the axon	
cell body lies outside of the CNS	
has many dendrites	
(motor neurones only) (sensory neurones only) (both sensory an	d motor neurones
Part C Sensory neurone examples	
Which of the following are examples of <b>sensory</b> neurones?	Select all that apply.
olfactory receptor neurones (neurones in the nasal cavity that res	spond to odours and send an impulse towards the brain)
photoreceptor cells e.g. rods and cones (neurones in the eye that	t respond to light and send impulses towards the brain)
thermoreceptors (neurones in the skin and other organs/tissues t towards the CNS)	hat respond to changes in temperature and send impulses
neurones in the femoral nerve that send impulses from the spinal at the knee	I cord to the muscles in the thigh to cause the leg to straighten

#### Part D Motor neurone examples

Which of the following are examples of <b>motor</b> neurones? Select all that apply.
mechanoreceptor neurones (neurones in the skin and other organs/tissues that respond to pressure/movement and send impulses towards the CNS)
neurones in the oculomotor nerve that send impulses from the brain to muscles in the eye to cause eye movement
neurones in the infundibulum that send impulses from the hypothalamus to the posterior pituitary gland to cause the release of hormones into the bloodstream
retinal ganglion cells (neurons that receive impulses from photoreceptor cells and send impulses to neurons in the brain)

Home Gameboard Biology Physiology Sense & Movement The Resting Membrane Potential

# The Resting Membrane Potential

Α	Lev	/el	Fui	the	er A
С	С	C	С	С	С

The resting membrane potential is the membrane potential of a neuron when it is "at rest" i.e. not firing. The resting membrane potential of most neurones is approximately  $-65\,\mathrm{mV}$  i.e. the inside of the cell is  $65\,\mathrm{mV}$  more negative than the outside of the cell.

Part A The sodium-potassium pump
The $Na^+/K^+$ pump (also called $Na^+/K^+$ -ATPase) plays an essential role in maintaining the membrane potential in all animal cells including neurones. Fill in the blanks below to explain how this works.
1. molecule(s) of ATP binds to a $Na^+/K^+$ pump.  2. This allows $Na^+$ ions to bind to the $Na^+/K^+$ pump on the of the membrane.
3. The ATP is converted to ADP and $P_i$ , which phosphorylates the $Na^+/K^+$ pump. This causes a conformational change in the shape of the $Na^+/K^+$ pump.
4. This causes the $\mathrm{Na^+}$ ions to be released to the $\phantom{aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa$
5. $K^+$ ions bind to the $Na^+/K^+$ pump on the of the membrane. This causes dephosphorylation of the $Na^+/K^+$ pump, which causes a conformational change back to the original shape.
6. This causes the ${ m K}^+$ ions to be released to the ${ m Constant}$ of the membrane. The process is now ready to begin again.
Because this process results in a net loss of charges from the cell, the inside of the cell becomes ly charged relative to the outside.
Items:
$\begin{array}{ c c c c c c c c c c c c c c c c c c c$

#### Part B Ion leakage

On its own, the  $\mathrm{Na}^+/\mathrm{K}^+$  pump would result in the cell becoming increasingly negative until there were no more  $\mathrm{Na}^+$  ions inside the cell. However, this is not the case. There are some ion channels that allow  $\mathrm{Na}^+$  to leak into the cell, and other ion channels that allow  $\mathrm{K}^+$  ions to leak out of the cell.

What is the name given to this kind of transport, in which ions move through channels down/with their concentration gradient?

### Part C $K^+$ equilibrium potential

On its own, the concentration gradient of  $K^+$  ions would cause them to leak out of the cell. However, the outside of the cell is more positively charged than the inside of the cell, which will counteract this movement of  $K^+$  ions. The movement of ions across a membrane is, therefore, based on **both** the chemical gradient **and** the electrical potential across the membrane. The electrical potential for which these two things balance out (for a particular ion) is called the equilibrium potential. At the equilibrium potential, the net movement of that ion across the membrane through its ion channel will be zero.

The Nernst equation can be used to calculate the equilibrium potential (E) in millivolts (mV) for a particular ion (X) given its valency (z), concentration inside the cell  $([X]_i)$ , and concentration outside the cell  $([X]_o)$ . The equation is as follows:

$$E_X = rac{61}{z} imes \log_{10} rac{[X]_o}{[X]_\mathrm{i}}$$

Use the Nernst equation (above) to calculate the equilibrium potential for  ${
m K}^+$  ions ( $E_{{
m K}^+}$ ) when:

- $\bullet~K^+$  concentration inside the cell (  $[K^+]_i)=120\,\mathrm{mM}$
- ullet  ${
  m K}^+$  concentration outside the cell ( $[{
  m K}^+]_o$ )  $= 4\,{
  m mM}$

Give your answer to 2 significant figures.

#### Part D ${ m Na}^+$ equilibrium potential

The Nernst equation can be used to calculate the equilibrium potential (E) in millivolts (mV) for a particular ion (X) given its valency (z), concentration inside the cell  $([X]_i)$ , and concentration outside the cell  $([X]_o)$ . The equation is as follows:

$$E_X = rac{61}{z} imes \log_{10} rac{[X]_o}{[X]_{
m i}}$$

Use the Nernst equation (above) to calculate the equilibrium potential for  ${
m Na}^+$  ions  $(E_{{
m Na}^+})$  when:

- ullet Na $^+$  concentration inside the cell ([Na $^+$ ]i) =  $15\,\mathrm{mM}$
- ullet Na $^+$  concentration outside the cell ([Na $^+$ ] $_o$ )  $=145\,\mathrm{mM}$

Give your answer to 2 significant figures.

#### Part E Neurone resting membrane potential

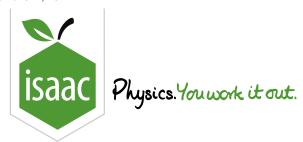

The resting membrane potential of most neurones is  $\approx -65\,\mathrm{mV}$ . Based on your answers to the previous sections, which of the following conclusions can you draw? Select all that apply.

The resting membrane potential is closer to the equilibrium potential of $ m K^+$ than to the equilibrium potential of $ m Na^+$
The resting membrane potential is closer to the equilibrium potential of $\mathrm{Na}^+$ than to the equilibrium potential of $\mathrm{K}^+$
There is more leakage of $ m K^+$ ions across the neurone membrane than leakage of $ m Na^+$ ions across the neurone membrane
There is more leakage of $\mathrm{Na}^+$ ions across the neurone membrane than leakage of $\mathrm{K}^+$ ions across the neurone membrane
There is the same amount of leakage of both types of ions across the neurone membrane

Home Gameboard Biology Physiology Sense & Movement Action Potentials

### **Action Potentials**

An action potential is a sequence of changes in membrane potential that occur at a particular point of a cell membrane in response to a stimulus. An action potential at one point of a cell membrane can trigger an action potential at a nearby point of a cell membrane. In neurones, this propagation of action potentials along the cell membrane is called a nerve impulse.

**Figure 1:** A series of action potentials. The membrane potential at a particular point of a cell membrane is shown over time.

#### Part A Resting membrane potential

State the value of the resting membrane potential in Figure 1

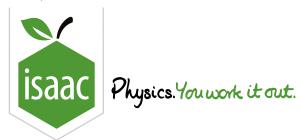

### Part B Depolarisation

Which of the following events occur between 1 and 1.5 milliseconds in <b>Figure 1</b> ?
Select all that apply.
voltage-gated $K^+$ channels open
voltage-gated $\mathrm{Na}^+$ channels open
$K^+$ ions flow <b>into</b> the cell through voltage-gated $K^+$ channels
$K^+$ ions flow <b>out of</b> the cell through voltage-gated $K^+$ channels

### STEM SMART Biology Week 39 - The Nervous System

Home Gameboard Biology Physiology Sense & Movement Synapses

## Synapses

A synapse is the junction between two neurones (or between a neurone and an effector e.g. a muscle fibre or gland cell). There are two types of synapse: electrical and chemical. Electrical synapses involve the direct movement of ions from one cell to another. Chemical synapses involve the transmission of an impulse via chemical messengers (neurotransmitters). Electrical synapses can transmit impulses more quickly, but chemical synapses are more flexible in terms of processing the impulses. Because of this, chemical synapses are far more common than electrical synapses.

#### Part A Synaptic transmission

Drag the items below into the correct order on the right to show how one neurone excites another neurone at a chemical synapse.

#### Available items

 ${
m Na}^+$  channels on the membrane of the postsynaptic neurone open and  ${
m Na}^+$  ions move in the membrane of the axon terminal is depolarised neurotransmitters bind to  ${
m Na}^+$  channels on the membrane of the postsynaptic neurone an action potential is triggered in the postsynaptic neurone and propagates along its dendron/axon neurotransmitters are released into the synaptic cleft an action potential is propagated along the axon of a presynaptic neurone vesicles containing neurotransmitters fuse with the axon terminal membrane voltage-gated  ${
m Ca}^{2+}$  channels in the membrane of the axon terminal open and  ${
m Ca}^{2+}$  ions move in

### Part B Synapse statements

	of the following statements are correct? Select all that apply.
	neurotransmitters are released by simple diffusion
	neurotransmitters are released by exocytosis
	neurotransmitters can only excite neurones (i.e. trigger an action potential), they cannot inhibit them (i.e. prevent an action potential)
	some neurotransmitters excite neurones (i.e. trigger an action potential) while others inhibit neurones (i.e. prevent an action potential)
	a postsynaptic neurone might require multiple action potentials in a short space of time from the same presynaptic neurone in order for it to produce its own action potential
	a postsynaptic neurone might require multiple, simultaneous action potentials from several presynaptic neurones in order for it to produce its own action potential
Part C	Electrical vs chemical synapses
In elections to not phy	Electrical vs chemical synapses  trical synapses, the two neurones are physically connected by membrane protein channels that allow move directly from the cytoplasm of one cell to the next. In chemical synapses, the two neurones are vsically connected to each other. The impulse in the presynaptic neurone triggers a release of ransmitters which can then trigger an impulse in the postsynaptic neurone.
In elections to not phyneuroti	trical synapses, the two neurones are physically connected by membrane protein channels that allow move directly from the cytoplasm of one cell to the next.
