

<u>Home</u> <u>Gameboard</u> Chemistry Inorganic Transition Metals Cobalt Complexes Equilibrium

Cobalt Complexes Equilibrium

This question is about the following equilibrium:

$$\operatorname{CoCl_4}^{2-}(\operatorname{aq}) + 6\operatorname{H_2O}(\operatorname{l}) \mathop{\Longrightarrow}\limits_{\operatorname{pink}} \left[\operatorname{Co}(\operatorname{H_2O})_6\right]^{2+}(\operatorname{aq}) + 4\operatorname{Cl}^-(\operatorname{aq})$$

Part A Temperature dependence

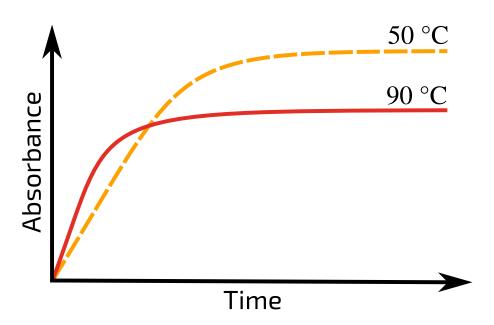

Two students decided to investigate this equilibrium. They are supplied with the equilibrium mixture at room temperature.

- One student heats $20\,\mathrm{cm}^3$ of the mixture to $50\,^\circ\mathrm{C}$.
- The other student heats $20\,\mathrm{cm^3}$ of the mixture to $90\,^\circ\mathrm{C}$.

The students use colorimetry to observe how the colour of the equilibrium mixture changes over time.

- The colorimeter is set up so that the greater the absorbance, the greater the concentration of $[\mathrm{Co}(\mathrm{H_2O})_6]^{2+}$.
- The initial absorbance is set to zero.
- The absorbance is recorded every 30 seconds.

The students plot the graph below from the results of the experiment.

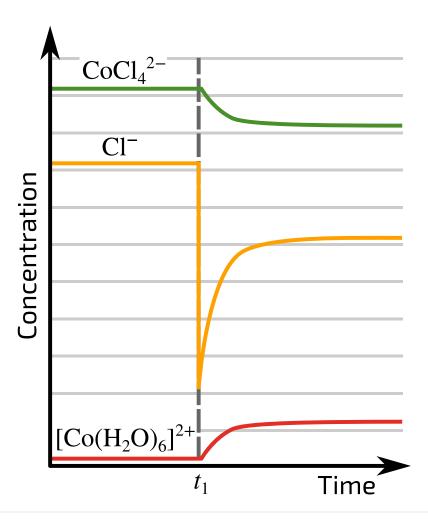

At the temperature, particles	have more kinetic energy: they move faster and have
collisions. Each collision is also	likely to exceed the activation energy and therefore be
successful, leading to a rate	of reaction. This explains the steeper initial gradient.
However, at this temperature, the plateau equilibrium concentration of $[\mathrm{Co}(\mathrm{H_2O})_6]$ than the enthalpy of the reaction	2+ is . This means the enthalpy of the products is
Items:	
more less higher lower fewe	r

Part B Silver nitrate

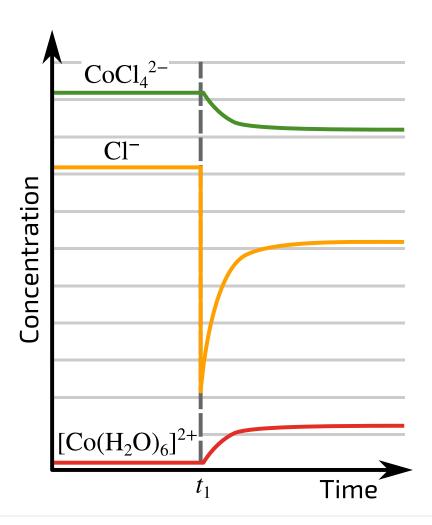

The students investigate how addition of aqueous silver nitrate, $\mathrm{AgNO_3}\left(\mathrm{aq}\right)$, affects the equilibrium position. The graph below shows the changes in the equilibrium concentrations of $\mathrm{CoCl_4}^{2-}$, Cl^- and $\left[\mathrm{Co}(\mathrm{H_2O})_6\right]^{2+}$ after addition of the $\mathrm{AgNO_3}\left(\mathrm{aq}\right)$.

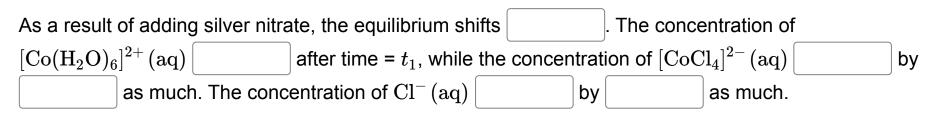

The $AgNO_3$ (aq) is added at time = t_1 .

Write an ionic equation, including state symbols, which explains the sharp drop in the ${\rm Cl}^-$ concentration at time = t_1 .

Part C Reequilibration

Items:

 six times
 equally
 twice
 increases
 left
 five times
 four times
 right
 decreases
 thrice

Part D Valence electrons

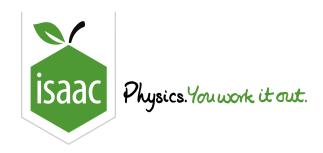

The colours of the two cobalt complexes are due to transitions of valence electrons between different energy levels.

How many valence electrons does a Co^{2+} ion have?

Part E Geometries

This ligand substitution reaction is accompanied by a change in geometry of the transition metal complex. Describe this change in the format "X to Y" (for example, "linear to trigonal planar").

Parts A-C adapted with permission from OCR, A Level Chemistry A, June 2022, H432/03, Question 4; Parts D-E created for isaacphysics.org by Andrea Chlebikova

<u>Home</u> <u>Gameboard</u> Chemistry Inorganic Transition Metals A Bidentate Ligand

A Bidentate Ligand

A bidentate ligand has two lone pairs of electrons that it can donate to a transition metal ion, to form two coordinate bonds.

Part A Synthesis

A bidentate ligand can be produced by reacting 1,2-dichloroethane with two equivalents of ammonia.

Use the <u>structure editor</u> to draw the bidentate ligand that forms in this reaction.

Give your answer as a SMILES string.

In the editor, after drawing your structure, click on the round, yellow smiley face to generate a SMILES string. Copy the SMILES string and paste it in the answer box.

<u>Using the structure editor</u>

Part B Cobalt complex

The Co^{3+} ion can form a complex by associating with three molecules of this bidentate ligand per metal ion. How many different isomers of this complex exist?

Part C Complex cobalt complex

The Co^{3+} ion can also form a complex by associating with two chloride ions and two molecules of the bidentate ligand per metal ion. How many different isomers of this complex exist?

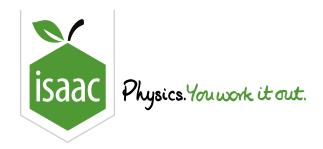

Part D EDTA

The bidentate ligand can be used to synthesise EDTA, by replacing each hydrogen bonded to a nitrogen with a side-chain featuring a carboxylate group. Each carboxylate group can donate a lone pair each. How would you describe this ligand, in reference to the number of dative bonds it forms?

 ${\color{red} \underline{\mathsf{Home}}}$ ${\color{red} \underline{\mathsf{Gameboard}}}$ Chemistry Inorganic Transition Metals Palladium (II) salts

Palladium(II) salts

Palladium(II) salts can form square planar complexes. Successive addition of ammonia and hydrogen chloride to an aqueous palladium(II) salt produces, under different conditions, three compounds with empirical formula ${\rm PdN_2H_6Cl_2}$. Two of these, **A** and **B**, are neutral complexes, with $M_r=211$. **A** has a dipole moment whereas **B** has none. The third compound, **C**, is ionic with $M_r=422$ and contains palladium in both its cation and anion.

Part A Compounds A and B

What is the formula of compounds A	and B ? Give your	r answer starting	g with the metal i	on followed b	y any
ligands.					

Part B A and B isomerism

What kind of isomerism is present between compounds **A** and **B**?

Part C Compound C cation

Give the formula and charge of cation of compound ${\bf C}$ in the format $[{\bf Pd}\cdots]^{n+}$.

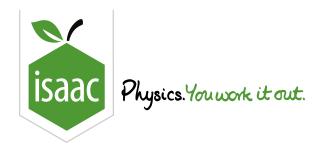

Part D Compound C anion

Give the formula and charge of anion of compound ${\bf C}$ in the format $[{\rm Pd}\cdots]^{n-}$.

STEM SMART Chemistry Week 50

Home Gameboard Chemistry Inorganic Periodic Table Al and Fe

Al and Fe

Aluminium, Al, and iron, Fe, are both metallic elements. However, their compounds show significant differences in their properties. For example, aluminium compounds are usually colourless and they contain the metal in only one oxidation state. In contrast, most iron compounds are coloured and the metal can be present in a variety of oxidation states.

Part B Fe configuration

What is the ground-state electron configuration of Fe?

Items:

 $oxed{[Ne]} egin{bmatrix} [Ar] \ \hline [Xe] \ \hline \end{bmatrix} egin{bmatrix} [Xe] \ \hline \end{bmatrix} egin{bmatrix} 3s \ \hline \end{bmatrix} egin{bmatrix} 4s \ \hline \end{bmatrix} egin{bmatrix} 3d \ \hline \end{bmatrix} egin{bmatrix} 4p \ \hline \end{bmatrix} egin{bmatrix} 1 \ \hline \end{bmatrix} egin{bmatrix} 3 \ \hline \end{bmatrix} egin{bmatrix} 4 \ \hline \end{bmatrix} egin{bmatrix} 5 \ \hline \end{bmatrix} egin{bmatrix} 6 \ \hline \end{bmatrix}$

art C Al oxidation state
What is the only non-zero oxidation state observed for aluminium?
art D Oxidation states of ${ m Fe}$
What are the two commonly found non-zero oxidation states for ${ m Fe}$?
+1
+2
+3
+4
+6
+7
+8
art E Maximum oxidation state of ${ m Fe}$
n theory, what is the highest oxidation state possible for ${ m Fe}$?

Part F Thiocyanate ion

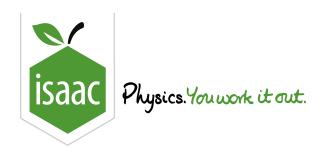

A common test for the presence of Fe ions is the addition of thiocyanate ions, $(SCN)^-$. The result is a blood-red colour, caused by the formation of the complex ion $[Fe(SCN)]^{2+}$.

Using the <u>structure editor</u>, draw a possible structure for the thiocyanate ion. Give your answer as a SMILES string copied from the editor (click the smiley face in the top left of the editor to generate this).
